## Therapeutic Management of Adult Patients with COVID-19

**Ontario COVID-19 Drugs and Biologics Clinical Practice Guidelines Working Group**

Recommendations apply to patients >18 years of age. Recommendations are based on the best available data and may change as additional data becomes available. Science Briefs can be found on the Ontario COVID-19 Science Advisory Table website.

### SEVERITY OF ILLNESS

#### Critically Ill Patients

- **Patients requiring ventilatory and/or circulatory support, including high-flow nasal oxygen, invasive mechanical ventilation, or ECMO**

  - **Desmethylone**: 6 mg PO/V daily for 10 days (or until discharge if sooner) is recommended. **Tocilizumab** is recommended for patients who are on recommended doses of desmethylone therapy (or a dose-equivalent corticosteroid) AND are within 14 days of hospital admission (or within 14 days of a new COVID-19 diagnosis if the infection was nosocomially acquired).

  - **RECOMMENDATIONS FOR DRUG SHORTAGE SITUATIONS**
    - In drug shortage situations, a single dose of tocilizumab 400 mg IV or sarilumab 400 mg IV should be used for all eligible patients. A second dose of tocilizumab or sarilumab should not be given to any patient.
    - **Barticinib**: 4 mg PO/NG daily for 14 days (or until discharge if sooner) is recommended in patients who are on recommended doses of desmethylone therapy (or a dose-equivalent corticosteroid) or who have a contraindication to corticosteroid treatment. The panel does not recommend combined use of baricitinib and IL-6 inhibitors due to absence of safety and efficacy evidence.
    - **Desmethylasone**: 12 mg PO/V daily for 10 days (or until discharge if sooner) may be considered in patients who are unable to receive IL-6 inhibitors (tocilizumab, sarilumab) or baricitinib. This recommendation is based on very low certainty evidence of reduction in days alive without life support, and the need for inpatient treatment options with a reasonable safety profile during an anticipated spike in COVID-19 cases due to the Omicron variant and widespread shortages of IL-6 inhibitors and baricitinib.

#### Moderately Ill Patients

- **Patients newly requiring low-flow supplemental oxygen**

  - **Desmethylone**: 6 mg PO/V daily for 10 days (or until discharge if sooner) is recommended. **Tocilizumab** is recommended for patients who are discharged with home-based oxygen therapy, desmethylone 6 mg PO daily until oxygen is no longer required (for a maximum of 10 days) may be considered.
  
  - **Remdesivir**: 200 mg IV on day 1, then 100 mg IV daily for 4 days is recommended.
  
  - **Therapeutic dose anticoagulation** may be considered over prophylactic dose anticoagulation in patients who are felt to be at low risk of bleeding.
  
  - All other patients should receive prophylactic dose anticoagulation.
  
  - **SARS-CoV-2 neutralizing antibodies** are not recommended for moderately ill patients. For symptomatic patients with nosocomial infection, see mild ill recommendations for sotrormivab on page 2.

  - **RECOMMENDATIONS FOR DRUG SHORTAGE SITUATIONS**
    - In drug shortage situations, a single dose of tocilizumab 400 mg IV or sarilumab 400 mg IV should be used for all eligible patients. A second dose of tocilizumab or sarilumab should not be given to any patient.
    - **Barticinib**: 4 mg PO/NG daily for 14 days (or until discharge if sooner) is recommended in patients who are on recommended doses of desmethylone therapy (or a dose-equivalent corticosteroid) or who have a contraindication to corticosteroid treatment. The panel does not recommend combined use of baricitinib and IL-6 inhibitors due to absence of safety and efficacy evidence.

#### Mildly Ill Patients

- **Go to page 2 for recommendations in mildly ill patients**

### CURRENTLY NOT RECOMMENDED*

- **Colchicine**
- **Interferon** (with or without ribavirin and ribavirin)
- **Vitamin D**

### RECOMMENDED AGAINST*

- **Antibiotics (antimicrobial)**
- **Cassimivir-iodeximab** due to lack of neutralizing activity against the Omicron variant
- **Hydroxychloroquine or Chloroquine**
- **Ivermectin**
- **Lopinavir/ritonavir**

* Applies to patients with any severity of illness

**RECOMMENDATIONS**

- **Prophylactic dose low molecular weight or unfractionated heparin** is recommended. These patients should not receive therapeutic dose anticoagulation unless they have a separate indication for this treatment.

- **Remdesivir** is not recommended for patients receiving mechanical ventilation.

- **SARS-CoV-2 neutralizing antibodies** are not recommended for critically ill patients.

- **Bacterial co-infection is uncommon in COVID-19 pneumonia at presentation. Do not add empiric antibiotics for bacterial pneumonia unless bacterial infection is strongly suspected. Continue empiric antibiotics for no more than 5 days, and de-escalate on the basis of microbiology results and clinical judgment.**

- **IL-6 inhibitors and baricitinib.** inpatient treatment options with a reasonable safety profile during an anticipated drug shortage situations, a single dose of tocilizumab 400 mg IV or sarilumab 400 mg IV should be used for all eligible patients. A second dose of tocilizumab or sarilumab should not be given to any patient.

**RECOMMENDATIONS FOR DRUG SHORTAGE SITUATIONS**

- In drug shortage situations, a single dose of tocilizumab 400 mg IV or sarilumab 400 mg IV should be used for all eligible patients. A second dose of tocilizumab or sarilumab should not be given to any patient.

- **Bacticinib**: 4 mg PO/NG daily for 14 days (or until discharge if sooner) is recommended in patients who are on recommended doses of desmethylone therapy (or a dose-equivalent corticosteroid) or who have a contraindication to corticosteroid treatment. The panel does not recommend combined use of baricitinib and IL-6 inhibitors due to absence of safety and efficacy evidence.
This guidance applies to mildly ill patients in any setting, including the community, hospital (including nosocomial cases), and congregate care settings.

- It is recommended that eligibility for outpatient therapies include patients who test positive for SARS-CoV-2 on either PCR or a healthcare-professional administered RAT or ID Now.

### RISK LEVEL

**Mildly Ill Patients**

Patients who do not require new or additional supplemental oxygen from their baseline status

### RECOMMENDATIONS

**HIGH RISK OF SEVERE DISEASE**

- **Tier 1**
  - Sotrovimab: 500 mg IV x 1 dose is recommended for these patients if they present within 7 days of symptom onset.
  - These individuals should have a reasonable expectation for 1-year survival prior to SARS-CoV-2 infection.
  - It is recommended that monoclonal antibody therapy be administered to non-hospitalized individuals across Ontario using a hybrid network that includes, but is not limited to, mobile integrated healthcare services, community paramedicine, and outpatient infusion clinics.

- **Tier 2**
  - Sotrovimab may be considered for patients with mild COVID-19 illness presenting within 7 days of symptom onset. The recommended starting dose is 50 mg PO daily, titrated up to 300 mg PO twice daily for a total of 15 days. Pharmacist consultation and outpatient provider follow-up is important to avoid any significant adverse drug interactions with fluvoxamine. This recommendation balances the very low certainty evidence of benefit for preventing hospitalization with the need for management options for mild illness with a reasonable safety profile during a surge in COVID-19 cases due to the Omicron variant. Budesonide 800 mcg inhaled twice daily for 14 days may be considered for these patients. This recommendation is based on very low certainty evidence of reduction in duration of symptoms, and the need for outpatient treatment options with a reasonable safety profile during an anticipated spike in COVID-19 cases due to the Omicron variant. Budesonide may have a role as an additional therapy in patients already on other therapies who have respiratory symptoms.

### MODERATE RISK

- **Tier 3**
  - Remdesivir: 200 mg IV on day 1, then 100 mg IV daily for 2 days may be considered for these patients if they present within 7 days of symptom onset and: (1) more effective therapeutic options (i.e. sotrovimab) are not available; and (2) intravenous administration is not a barrier.
  - These individuals should have a reasonable expectation for 1-year survival prior to SARS-CoV-2 infection.

- **Tier 4**
  - Fluvoxamine: 50 mg PO daily titrated up to 100 mg PO twice daily for a total of 15 days may be considered for these patients if they present within 7 days of symptom onset. See fluvoxamine recommendation statement for higher risk mildly ill patients.
  - Budesonide: 800 mcg inhaled twice daily for 14 days may be considered for these patients. See budesonide recommendation statement for higher risk mildly ill patients.

### LOWER RISK

- **Tier 5**
  - Sotrovimab is not recommended for these patients. This recommendation is based on current limited supply of sotrovimab, and prioritizing its administration in patients at greatest risk of progressing to severe disease.

- **Tier 6**
  - Reassurance and information for self-monitoring of symptoms (including self-monitoring of oxygen saturation) are recommended.
  - Sotrovimab may be considered for these patients if they present within 7 days of symptom onset and intravenous administration is not a barrier.
  - Remdesivir is not recommended for these patients. This recommendation is based on current limited supply of sotrovimab, and prioritizing its administration in patients at greatest risk of progressing to severe disease (those who are moderately ill, followed by those who are mildly ill but at higher risk of progression).
  - Fluvoxamine is not recommended.
  - Budesonide is not recommended.

- There is currently insufficient evidence to make a recommendation around aspirin or anticoagulation for mildly ill patients.

The following therapies are not recommended in mildly ill patients: dexamethasone, tacrolimus, sarilumab, and baricitinib.

---

1. Examples of immunocompromised or immunosuppressed individuals include individuals with active treatment for solid tumor and hematologic malignancies, recipients of solid-organ transplant and taking immunosuppressive therapy, recipients of chimeric antigen receptor (CAR) T-cell or hematopoietic stem cell transplant (within 2 years of transplantation or taking immunosuppression therapy), moderate or severe primary immunodeficiency (e.g., DiGeorge syndrome, Wiskott-Aldrich syndrome, common variable immunodeficiency, Good’s syndrome, hyper IgG syndrome, advanced or untreated HIV infection, active treatment with high-dose corticosteroids (i.e., ≥20 mg prednisone or equivalent per day when administered for ≥2 weeks), allogeneic transplant recipients, transplant-related immunosuppressive drugs, cancer chemotherapeutic agents classified as severely immunosuppressive, tumor necrosis factor (TNF) blockers, and other biologic agents that are immuno-suppressive or immunomodulatory. For individuals who are immunosuppressed or receiving immunosuppressants, their condition is considered both an underlying risk factor AND a marker of insufficient ability to mount an immune response to SARS-CoV-2. These individuals should have a reasonable expectation for 1-year survival prior to SARS-CoV-2 infection.

2. Unvaccinated is defined as individuals who have received one or zero doses of a COVID-19 vaccine.

3. Risk factors include obesity (BMI ≥30), dialysis or stage 5 kidney disease (eGFR <15 mL/min/1.73 m²), diabetes, cerebral palsy, intellectual disability of any severity, sickle cell disease, receiving active cancer treatment, solid organ or stem cell transplant recipients. If patients have, in the opinion of a physician, other important risk factors for disease progression beyond this list that merit the use of specific drugs or therapeutics, these should be clearly documented at the time of administration.

4. Although pregnancy is a risk factor for severe COVID-19, the absolute risk for this population remains low due to the young age and lack of comorbidities of most pregnant individuals. Considerations for the use of specific COVID-19 therapeutics should therefore be made on a case-by-case basis.
